

Banana, life size

Everything on this page is drawn at true scale. Nothing is enlarged.

Two banana cells, at the same scale

they are really down there. Zoom to about 12 000 % to read their labels

1 cm

banana drawn 15.3 cm along its curve

What you are looking at

The banana above is drawn at life size: 1 cm on the page is 1 cm of fruit.

The two cells beside it are drawn at that SAME scale, so they are as small on the page as they are in the fruit.

1 point = 352.8 micrometres, so the inner cell is 0.85 pt across and the skin cell is 0.17 pt. Their labels are 30 micrometres tall: 0.085 pt.

At a zoom where this whole page fits a screen, the pair of cells covers roughly one pixel. Reading the labels under them takes about 12 000 %. The arrow stops 600 micrometres short of them, which is two cell widths, and is why its point disappears before it reaches anything.

Drawn as vector geometry -- no raster images. Cell sizes are representative, not measurements of a particular fruit.
